Ultrasonic nondestructive testing (NDT) is a method used to characterize the internal volumes of materials. It works by propagating high-frequency sound waves well above the range of human hearing throughout the material. It can be used to detect flaws and discontinuities in metals,

Ultrasonic testing (UT) is being used to detect leaking BWR and PWR fuel rods. The testing method makes use of differences in scattering by water and gas of ultrasonic (pressure) waves as they are reflected between the inner and outer surfaces of fuel cladding. The UT process makes use of two probes, which move
