Languages and Tools for Hybrid Systems Design is a survey of languages and tools for the design and verification of hybrid systems. The book reviews and compares hybrid system tools by highlighting their differences in terms of their underlying semantics, expressive power and

mathematical mechanisms. The review concludes with a comparative summary, which suggests the need for a unifying approach to hybrid systems design. As a step in this direction, the case is made for a semantic-aware interchange format, which would enable the use of joint techniques, make a formal comparison between different approaches possible, and facilitate exporting and importing design representations. Languages and Tools for Hybrid Systems Design is also intended to equip researchers, application developers and managers with key references and resource

This book is intended as an undergraduate text introducing matrix methods as they relate to engineering problems. It

begins with the fundamentals of mathematics of matrices and determinants. Matrix inversion is discussed, with an introduction of the well known reduction methods. Equation sets are viewed as vector transformations, and the conditions of their solvability are explored. Orthogonal matrices are introduced with examples showing application to many problems requiring three dimensional thinking. The angular velocity matrix is shown to emerge from the differentiation of the 3-D orthogonal matrix, leading to the discussion of particle and rigid body dynamics. The book continues

with the eigenvalue problem and its application to multi-variable vibrations. Because the eigenvalue problem requires some operations with polynomials, a separate discussion of these is given in an appendix. The example of the vibrating string is given with a comparison of the matrix analysis to the continuous solution.
