the target. Ion implantation is used in semiconductor device fabrication and in metal finishing, as well as in materials science research. The ions can alter the elemental composition of the target (if the ions differ in composition from the target) if they stop and remain in the target.

[Ion implantation - Wikipedia](#)

Ion beam technology including ion implantation and ion irradiation is an efficient tool to realize material modification. Ion implantation technology can achieve the precise doping of almost all elements compulsorily, while ion irradiation can manage defect engineering, morphology control, and so on with people's intentions.

The effect of ion implantation on the physical and mechanical properties of the hard alloy plates based on tungsten carbide and a cobalt binder is described. A study of the effects of ion implantation on the phase composition and the structure of materials is presented; the development of displacement cascades during ion implantation and their influence on the formation of the structure of the processed materials are shown.
