## Angular Kinematics

**Practice Problems** Kinematic equations relate the variables of motion to one another. Each equation contains four variables. The variables include acceleration ( $a$ ), time ( $t$ ), displacement ( $d$ ), final velocity ( $v_f$ ), and initial velocity ( $v_i$ ). If values of three variables are known, then the others can be calculated

## Angular Kinematics

$\theta = \tan^{-1}(y/x) = \tan^{-1}(3/6) = \tan^{-1}(0.5) = 26.5651^\circ \approx 26.5^\circ$  north of east. Notice the direction takes the form of an angle,  $26.5^\circ$ , and a reference for the angle, north of east. The second part is given so that it is clear what axis the angle is being measured from and in what direction
