Convenience sampling is perhaps the easiest method of sampling, because participants are selected based on availability and willingness to take part. Useful results can be obtained, but the results are prone to significant bias, because those who volunteer to take part may be different from those who choose not to (volunteer bias), and the sample may not be representative of other characteristics, such as age or sex.

~~Sampling of Populations: Methods and Applications–4th–~~

There are two types of sampling methods: Probability sampling involves random selection, allowing you to make statistical inferences about the whole group. Non-probability sampling involves non-random selection based on convenience or other criteria, allowing you to easily collect initial data.

~~Sampling Methods | Types and Techniques Explained~~

Sampling definition: Sampling is a technique of selecting individual members or a subset of the population to make statistical inferences from them and estimate characteristics of the whole population. Different sampling methods are widely used by researchers in market research so that they do not need to research the entire population to collect actionable insights.

~~Types of Sampling: Sampling Methods with Examples–~~

Stratified sampling is a valuable type of sampling methods because it captures key population characteristics in the sample. In addition, stratified sampling design leads to increased statistical efficiency. Each strata (group) is highly homogeneous, but all the strata-s are heterogeneous (different) which reduces the internal dispersion.

~~Types of Sampling Methods in Research: Briefly Explained~~

Sampling is the process of selecting a representative group from the population under study. The target population is the total group of individuals from which the sample might be drawn. A sample is the group of people who take part in the investigation. The people who take part are referred to as “participants”.

~~Sampling Methods | Simply Psychology~~

Non-probability population sampling method is useful for pilot studies, case studies, qualitative research, and for hypothesis development. This sampling method is usually employed in studies that are not interested in the parameters of the entire population. Some researchers prefer this sampling technique because it is cheap, quick and easy.
