Their mobility and abundance, leafhoppers are not easy to control. However,... 2. Use row covers. Floating row covers or netting can be placed over plants early in summer to exclude leafhoppers. 3. Monitor with sticky traps. Many ...

Leafhoppers and planthoppers -
Missouri Botanical Garden
Leafhoppers and Planthoppers
There are over 12,500 varieties of leafhoppers and planthoppers, that feed on the sap from plants, grass, and trees but most are harmless to the plant. The planthopper gets its name because of its resemblance to leaves and other plants of their environment and from the fact

that they often hop like a grasshopper.

Leafhoppers and Planthoppers |
Weed It & Reap!
Many leafhoppers and
planthoppers, and some psyllids,
are important pests of crop
plants, particularly because they
are vectors of virus, bacteria and
phytoplasma diseases. Around
200 species are already known to
spread plant disease but many
more are likely to be recognised.
However, few comprehensive
identification guides are available
and details of pest species are
mostly widely scattered in the
specialist literature.

Leafhoppers are one of the most abundant groups of plant feeding insects in the world with leafhopper and planthopper species outnumbering that of all species of birds, mammals, reptiles, and amphibians combined! Many species are host specific with their names indicating their preferred host; e.g. rose leafhopper, grape leafhopper, potato leafhopper, etc. Leafhoppers are wedge shaped and vary in color depending on species.

Leafhoppers and planthoppers

Read Book The Leafhoppers And

Planthoppers are sucking insects that remove sap from the xylem and phloem tissues of the plant. High population infestations severely damage plants. Hopper damage is called "hopper burn" because plants dry up and take on the orange-yellowish to brownish appearance of plants that have been damaged by fire.

commoner species in rice fields to be identified, which is vital for the development of pest management strategies.

Handbook for the identification of leafhoppers and ...

The leafhoppers are a large and diverse family of sap-sucking, hopping insects. In overall body form, many look a lot like cicadas — only much smaller! You can distinguish them from similar groups of small hoppers by the hind legs, which have 1 or more rows of small spines on the hind tibiae (“shins”).

and wild rice species as sources of resistance.

Rice Resistance to Planthoppers and Leafhoppers

Because this is a large and diverse group, planthoppers may best be identified by determining that they are not treehoppers, leafhoppers, or spittlebugs/frohoppers:

Treehoppers have an enlarged pronotum (shieldlike part just behind the head) that extends backward to cover the abdomen; often it is shaped to resemble a thorn or wart on a twig.
